# **TURBOVANE FANS**

## **Design 1**

**Dimensions, Capacities, Horse Powers**

## Turbovane Fan—Design 1

Design 1 Turbovane Fan,  
Direct Coupled to Sturtevant Turbine.

Design 1 Turbovane Wheel.

# TURBOVANE FAN—DESIGN 1

## SPECIFICATIONS

**General.** There shall be furnished a No. . . . , Sturtevant Turbovane Fan. It shall be made (single or double) . . . . . inlet, (single or double) . . . . . width, (right or left) . . . . . hand, . . . . . discharge and have (full or  $\frac{3}{8}$ ) . . . . . housing. The wheel shall be not less than . . . . . " diameter, . . . . . " wide. The outlet shall be . . . . . " by . . . . . " , the diameter of the inlet shall be . . . . . " . The total height of the fan housing shall be . . . . . " , the width in direction of shaft . . . . . " , and the length transverse of shaft . . . . . " .

The fan shall have a capacity of . . . . . cubic feet per minute against a resistance of . . . . . " water gauge either at the inlet or at the outlet (or at both taking the sum) and shall operate at approximately . . . . . R.P.M., requiring approximately . . . . . B.H.P.

**Housing.** The housing shall be of spiral form constructed of steel plate strongly braced, bolted and riveted to a rigid frame of angle irons. The side plates and round-about sheet shall be made of No. 11 gauge plate. The outlet shall be rectangular in shape and consist of angle irons bolted to the housing and arranged for connection to a discharge duct. The inlet shall be of cone shape and so constructed as to allow the wheel to be taken out through the opening caused by the removal of the cone. The cutoff piece shall be made of a sheet bent 180 degrees upon itself and having the two ends bolted to the spiral sheet, thus leaving no edges of metal which can in any way be acted upon by the air issuing from the outlet so as to produce vibration, and therefore, noise at this point.

**Wheel.** The blades of the wheel shall be made of refined steel plate. The outer or discharge edge of the blade shall be parallel with the axis of the fan. The inner or intake edge shall be of greatest diameter at the inlet of the wheel and decrease in diameter as the back plate or hub is approached, thus producing a blade of greater depth at the back of the wheel. The blades shall be curved with their convex surface moving forward in rotation, and be of such shape that about two thirds of the depth of the blade from the outer edge in toward the center is formed in the curve of an involute of a circle. The remaining portion shall be formed in the arc of a circle. The blade curvature shall be such as allows the fan to handle the air very efficiently and at a relatively high peripheral speed compared with the pressure produced. The hub shall be made of a solid steel forging riveted to the driving disc and accurately bored and fitted with keyway and set screws. The blades shall be riveted at the end nearest the fan inlet to an annular steel plate ring or side plate, and at the end farthest from the fan inlet to a solid and extra heavy driving disc. The holes through which the blades are riveted to the side plates shall be punched to template as well as the blades themselves to insure the proper position of each blade in the wheel. Equally spaced along the axial length of the outer or discharge edge of the blades shall be placed two or more annular steel plate rings which add strength and rigidity to the wheel. The wheels shall be very carefully balanced.

**Bearings.** The bearings shall be of the oil tight, dust proof pedestal type, and by means of a spherical seat made self aligning. Each bearing shall be fitted with two oil rings which feed oil on to the shaft from a large oil well located in the bottom of the box. They shall be of large diameter and extra long to give ample bearing surface. Each bearing shall be fitted with oil throwing collars and oil baffles also with a leather gasket around the shaft and at the outboard end which absolutely prevents oil getting out of the bearing or dust getting into it. A small glass window shall be provided which shows the supply of oil in the bearing. The bearing shall be very rugged and heavily built for high speed duty, and lined with the best quality babbitt containing upwards of 85% tin. The bearings shall be carefully bored and scraped to exact size.

**Shaft.** The shaft shall be made of steel forging and after the keyways are cut, shall be accurately turned and ground.

# TURBOVANE FAN—DESIGN 1

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Noise.** Special attention is called to the construction of the cut-off point, which, considering fans in general, is the seat of most noise in the nature of a sustained metallic note. Obviously, any edge of metal whether directly or indirectly in the flow of air can be acted upon more or less like a reed and the design of cut-off in this fan avoids this condition.

The flow of air over the surfaces in a fan wheel and casing obviously produces any noise which may exist (a fan wheel revolving in a vacuum will produce no noise, assuming of course, proper mechanical balance in the wheel). The noise is also a function of the velocity of flow. In this fan the velocity at all points as the air passes through the wheel is lower than in the general run of fans of this type or as used for this service, thereby operating against the production of noise.

**Provision for Minimizing Losses.** The involute curve of the blade is not carried all the way in to the hub. The change of the curve in near the hub to the arc of a circle increases the port area at this point and also produces a blade shape which is more effective in starting the air through the wheel. By virtue of the involute form of the major part of the blade, the length of a normal from any blade to the adjacent blade will be constant at all points, thereby giving equal area to the passages through the blades and greatly lessening the losses due to eddy currents.

**Distortion.** The heavy annular steel plate rings closely spaced along the outer edge of the blades prevent them from bowing out at high speed and also equalize the discharge of air along the axial length of the blade.

**Strength and Rigidity.** The back plate, inlet side plate, intermediate steel rings, blades and hub are all made exceptionally heavy and assembled by the unsparing use of heavy rivets. This taken with the general design and proportion of the parts combines to produce a rigid and strong construction.

**Wearing Qualities.** Barring the metal of the fan itself being subjected to violent corrosion or chemical action of gases handled by the fan the brunt in the long run is borne by the shaft and bearings. Therefore, for long satisfactory service a shaft which is carefully turned and ground to gauge running in bearings containing a very high quality babbit metal is bound to show its worth.

Double Inlet

## No. 70 Turbovane Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

| Capacity 1000 lbs. per cubic foot Against Continuously Maintained Resistances |                     |                        |  |  |  |   |  |   |  |       |                  |       |                  |       |                  |       |

Double Inlet

## No. 110 Turbovane Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

# STEEL PLATE FAN—DESIGN 1

## SPECIFICATIONS

Furnish and erect a Sturtevant steel plate fan, ..... housed; ..... discharge; ..... hand; ..... inlet; overhung .....; capable of delivering ..... cubic feet of air per minute against a static pressure of ..... inches, when running at ..... R. P. M. and requiring not more than ..... H. P. The fan shall be ..... inches wide, with its outlet ..... inches by ..... inches and its inlet ..... inches diameter.

**Housing.** The fan shall be constructed with its housing side sheets of ..... gauge, its roundabout or scroll sheet of ..... gauge. The roundabout sheet shall be secured to the scroll angles by tap bolts of ample size spaced 5 inches on centers. Scroll angles shall be ..... inches x ..... inches x ..... inches. The sheets used in the housing shall be the best grade of blue annealed steel plate. Housing shall be substantially braced by angle iron stiffeners and shall be built upon an angle iron base of ample strength to give the required rigidity.

**Wheel.** The blast wheel shall be ..... inches in diameter, of the side plate type containing ..... floats of ..... gauge, with annular side plates of ..... gauge. The floats shall be strongly riveted to steel T-arms, ..... inches x ..... inches x ..... inches, firmly cast into a hub spider of cast iron. (In the smaller size wheels one spider only is used while in larger wheels two or more spiders are used as necessary.) The wheel shall be given a careful balance during and after assembly to insure vibrationless operation.

**Shaft.** The shaft shall be ..... inches in diameter of best open hearth steel turned and ground to exact size.

**Bearings.** The bearings shall be cast iron, split in a plane coincident with the center of the shaft, and lined with Sturtevant White Metal. They shall be carried in chairs so as to be self aligning.

Oiling shall be accomplished by means of brush oilers sunk in wells and held against the bottom of the shaft by spiral springs. This, combined with capillary attraction, insures a copious supply of oil being supplied at the right point.

Where the fans are to be used for the handling of hot gases, bearings shall be furnished containing cored passages with outlets tapped for pipe connections so that effective water circulation may be secured.

In the case of large fans, pillow block type bearings shall be furnished in place of the chair box type.

# STEEL PLATE FAN—DESIGN 1

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Wheel.** On account of the higher peripheral speeds of the larger sizes, greater strength is necessary than in the smaller sizes. For this reason steel T-arms are cast into the hub rather than making the spider of one casting.

**Bearings.** The brush oiling arrangement has proved itself extremely satisfactory in service. Ring oil bearings, however, will be supplied if specified.

## **Steel Plate Fan—Design 1**

### **EXPLANATION OF TABLES**

The general explanation of tables given at the front of this book applies without exception to the following tables.

# Steel Plate Fan—Design 1

Double Inlet

## 30" Steel Plate Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances.

Double Inlet

**35" Steel Plate Fan—Design 1**

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances.

Double Inlet

## 40" Steel Plate Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances.

Double Inlet

## 80" Steel Plate Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## 140" Steel Plate Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances.

Double Inlet

## 160" Steel Plate Fan—Design 1

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances.

# **STEEL PLATE FANS**

## **Design 2**

**Dimensions, Capacities, Horse Powers**

Double width wheel for Sturtevant High Speed Steel Plate Fan

Wheel of Sturtevant High Speed Steel Plate Fan. - Note the angle irons which attach blades to side plates, and reinforcing strips around inlet and periphery of wheel

Housing of Sturtevant High Speed Steel Plate Fan

Steel Plate Fan Driven through Sturtevant Gears by Sturtevant Turbine

# STEEL PLATE FAN—DESIGN 2

## SPECIFICATIONS

There shall be furnished a No. . . . . Design 2, Sturtevant Steel Plate Fan. It shall be made (single or double) . . . . . inlet, (single or double) . . . . . width, (right or left) . . . . . hand, . . . . . discharge, and three-quarter housing. The wheel shall be not less than . . . . . inches diameter, . . . . . inches wide. The outlet shall be . . . . . inches x . . . . . inches. The diameter of the inlet shall be . . . . . inches. The total height of the fan housing shall be . . . . . inches. The width in direction of the shaft . . . . . inches, and the length transverse to shaft . . . . . inches. The fan shall have a capacity of . . . . . cubic feet per minute against a resistance of . . . . . inches water gauge either at the inlet or at the outlet (or at both taking the sum) and shall operate at approximately . . . . . R. P. M. requiring approximately . . . . . B. H. P.

**Housing.** The housing shall be of spiral form constructed of steel plate strongly braced, bolted and riveted to a rigid frame of angle irons. The outlet shall be rectangular in shape and shall consist of angle irons bolted to the housing and arranged for connection to a discharge duct.

**Wheels.** The blades and side plate of the wheel shall be refined steel plate. The side plate shall be reinforced around the inlet and periphery with reinforcing rings. The outer edges of all blades shall be reinforced with angle irons. Both blades and side plates shall be punched to templates to insure accuracy. To give proper strength the blades shall be attached to the side plates by means of angle irons. Single width wheels shall have two spiders; and double width wheels, four spiders. The spiders shall consist of steel T-arms cast into the hub. Hubs shall be accurately bored and fitted with key ways and set screws. The complete wheel shall be supported from two pedestal type bearings entirely independent of the fan housing.

**Bearings.** The bearings shall be of rigid type, and to insure an ample supply of oil to the surfaces, shall be provided with three brass rings and a carefully grooved cap. To prevent oil from escaping from the ends of the bearings and to return it to the reservoir, both upper and lower boxes shall be provided with suitable oil grooves. A sight oil gauge shall be located in the lower half of the bearing to indicate the height of the oil in the reservoir. An overflow to prevent overfilling shall also be provided. The bearing shall be designed with water passages so that cooling water may be circulated when necessary.

**Shaft.** The shaft shall be made from a steel forging turned, splined, and ground to exact finish.

# STEEL PLATE FAN—DESIGN 2

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Noise.** These fans are designed primarily for the slower speeds and therefore have comparatively large diameter wheels. This makes it possible to obtain the necessary tip speed to develop the desired pressures without using excessive rotative speeds. Also, on account of the peculiar construction of the fan wheel, the air velocities through the fan are low and uniform. This slow rotative speed, combined with the low air velocities, results in practically noiseless operation under ordinary conditions.

**Structural Design.** The satisfactory operation of a fan, from the standpoint of strength and freedom from distortion, is determined entirely by the design of the fan wheel and of the bearings since the construction of the housing is comparatively simple and means only the proper distribution of material to resist the air pressure within the casing. In this fan wheel all of the principal members are radial, are of simple design, and are therefore best suited to resist the stresses tending to wreck or distort the fan. The fan blades are flat and are supported on at least two spiders properly located on the float so as to equalize the loading on the float. The floats are also reinforced at the tip so as to prevent distortion at this point.

The spiders are built up of steel T-arms cast into heavy semi-steel hubs and are carefully fitted and keyed to the fan shaft. The spiders are secured in proper position by steel side plates on the sides of the floats. These side plates are secured to the floats by rolled steel angles and are further reinforced by steel bands at both the inside and outside diameters. After the wheel has been assembled, it is carefully balanced to insure against vibration when in operation. Throughout the construction of this wheel hot riveting is used exclusively, thereby insuring the complete filling of all holes and preventing the movement of any of the parts with respect to one another.

The bearings used in connection with this fan are of heavy, rigid, ring-oiling type and are mounted on cast-iron pedestals which are set independently of the fan housing. This insures a secure bearing for the fan wheel and prevents any vibration which might be caused by connection to the fan casing. The bearing pedestals are made as low as permissible to obviate any possibility of vibration which is usually incidental to high supports. The bearings are lined with the highest grade babbitt bearing metal and are scraped to exactly fit the shaft which insures perfect operation at the start and makes it unnecessary to run the bearings into shape.

# REVERSIBLE AND CONVERTIBLE STEEL PLATE EXHAUSTER WITH MULTIBLADE WHEEL—DESIGN 6

## SPECIFICATIONS

There shall be furnished a . . . . . inch Design 6 Steel Plate Planing Mill Exhauster. It shall be Reversible and Convertible as to hand and discharge. The inlet shall be . . . inches in diameter, and the outlet . . . . . inches by . . . . . inches.

**Housing.** The housing shall be made of steel plate side sheets of No. 13 gauge secured to cast-iron cone and inlet side plates by tap bolts threaded into an annular steel ring which is riveted to the inside of the steel plate side sheet.

The roundabout or scroll sheet shall be secured to the scroll angle by cap screws spaced five inches on centers.

**Wheel.** Blast wheel shall be of Multiblade type containing 18 floats, formed and curved in the direction of rotation. These floats shall be placed between annular side sheets. The wheel shall be carried upon a spider formed of steel T-arms cast into a hub. The wheel shall be . . . . . inches in diameter. It shall be accurately balanced during and after construction to insure perfect running balance.

**Shaft.** The shaft shall be made of the best open hearth steel turned and ground to size after keyways have been cut. It is to be . . . inches in diameter.

**Bearings.** The bearings are to be of the ring oiling, self-aligning type, lined with Sturtevant white metal, and shall be of extra length to give ample bearing surface.

# REVERSIBLE AND CONVERTIBLE STEEL PLATE EXHAUSTER WITH MULTIBLADE WHEEL—DESIGN 6

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Housing.** The feature of this type is the ease with which it can be changed from any hand or discharge to any other hand or discharge. This is done by removing a few bolts, turning the casing around and then replacing the bolts.

The housing is so shaped as to give large capacity and high efficiency.

**Wheel.** The forwardly curved blades of the blast wheel give a comparatively high pressure for any given peripheral speed of the wheel. This fan is therefore suited for operation against high pressures.

## **Reversible and Convertible Steel Plate Exhausters with Multiblade Wheel Design 6**

### **EXPLANATION OF TABLES**

These fans were originally designed for use in connection with cotton gin apparatus but they are suitable for any work within their capacities. The general explanation in the front of this book applies to the following tables.

# STEEL PLATE PLANING MILL EXHAUSTER—DESIGN 1

## SPECIFICATIONS

There shall be furnished a . . . . . inch, Design 1 Sturtevant Steel Plate Planing Mill Exhauster to be . . . . . hand, . . . . . discharge, with pulley . . . . . inches in diameter by . . . . . inches face. The blast wheel shall be . . . . . inches in diameter containing floats of . . . . . gauge. The floats shall be securely riveted to steel T-arms cast into the hub.

The housing shall have side sheets of . . . . . gauge and a roundabout sheet of . . . . . gauge. The roundabout sheet is to be secured to the scroll angle by tap bolts  $\frac{3}{8}$ -inch, and spaced five inches on centers. The inlet shall be . . . . . inches in diameter. The outlets are cylindrical and are cast on fans 30 to 80 inches inclusive except the down blast. In the down blast fan the outlet is part of the base casting. In sizes 90 to 100 inches fans the outlets are rectangular and built of angle iron. The cut-off piece shall be made of a sheet so built and so attached to the spiral sheet as to limit its vibration and therefore reduce noise.

**Shaft.** The shaft shall be made of steel forging and after the keyways are cut, shall be accurately turned and ground.

**Bearings.** The bearing shall be lined with the best quality babbit, containing upwards of 85 per cent. tin, bored and scraped to size.

# STEEL PLATE PLANING MILL EXHAUSTER—DESIGN 1

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Wearing Qualities.** On account of the severe service to which Planing Mill Exhausters are subjected, the casing and wheel of this fan are of exceptionally heavy gauge 'so as to give many years of satisfactory service. Furthermore a great deal depends upon the shaft and bearings, and a shaft which is carefully turned and ground to gauge, and which runs in bearings containing a very high quality babbitt metal, is bound to show its worth.

## SLOW SPEED LOW POWER PLANING MILL EXHAUSTER—DESIGN 6

### SPECIFICATIONS

Contractor shall furnish one Sturtevant No. . . . . Design 6, Slow Speed Low Power Exhauster. It shall have an inlet . . . . . inches in diameter, an outlet . . . . . inches x . . . . . inches. It shall be convertible and reversible as to hand and discharge. It shall contain a blast wheel . . . . . inches in diameter, comprising eighteen floats each carried on a steel T-arm cast into a central hub, these blades to be tilted forwardly in the direction of rotation at their outer edges. The blades shall be connected only at their rear or edges most remote from the fan inlet, with an annular back plate. The floats shall be made of No. . . . . gauge.

**Housing.** The housing shall be of the convertible and reversible type made up of steel side sheets secured to cast-iron inlet and cone side plates by tap bolts threaded into an annular ring riveted to the steel side sheet.

The roundabout or scroll sheet shall be secured to the scroll angles by bolts so as to be easily replaced if necessary. The scroll angles shall be riveted to the outer side of the side sheets. Rivets and bolts shall be spaced either 5 inches or  $2\frac{1}{2}$  inches on centers as may be most desirable for the work in question.

**Hanger.** The hanger shall be of grey iron fastened to the cone side plate by tap bolts and of the design shown in the illustration herewith. It shall be machined at the top to receive the bearings.

**Bearings.** The bearings shall consist of a cast-iron housing which in itself forms an oil reservoir and mounted within which are split sleeves lined with the best grade of Sturtevant white metal. These sleeves shall be mounted in a spherical seat so as to be self-aligning in all directions. Oiling shall be by two oil rings dipping into the reservoir. Combination thrust and oil wiper collars shall be provided for both ends of each bearing. Bearing housings shall be recessed at either end and fitted with felt washers. Sight glasses shall be inserted in the bearing housings. The filler cap shall be so located as to prevent an excess of oil being carried in the reservoir. The bearing housing shall be machined where it bolts to the hanger and shall be secured thereto by two bolts of ample size.

## **SLOW SPEED LOW POWER PLANING MILL EXHAUSTER—DESIGN 6**

### **EXPLANATION OF SPECIFICATION REQUIREMENTS**

Design 6, Slow Speed Low Power Exhauster is the most efficient fan of its type on the market. It is designed for very large capacity and relatively low rotative speed. It is unique in that it occupies less space for a given volumetric capacity than any other fan generally used for the same class of work.

**Housing.** The Convertible and Reversible feature enables the fan to be changed to any hand or discharge by removing a few bolts, turning the casing around and replacing the bolts.

**Hanger.** The hanger is “low-cut” so that a large pulley can be used if desired. This hanger also permits the use of a belt coming up from below at a sharp angle.

## **Slow Speed Low Power Planing Mill Exhauster—Design 6**

### **EXPLANATION OF TABLES**

The capacities of these fans are measured in a pipe the size of the fan inlet and upon the inlet side of the fan, with outlet also connected to a pipe of the same size by a taper transformation piece.

The tables are made upon this basis because fans used for conveying are usually piped in this manner.

Other than the above the information contained in the general explanation of tables shown at the front of this book applies.
